

type **CHBP**

Silicone rubber has been implemented in the utility market for more than 25 years and is becoming the polymeric material of choice for application at distribution, transmission and substation. Balestro chose silicone for its exceptional performance durability and insulation characteristics. Inherent to silicone are its ability to maintain its natural hydrophobicity over its service life plus maintain stability against high temperatures, flashovers and UV radiation. Balestro silicone cutouts weigh less than of their porcelain counterparts. The insulator body is a one-piece silicone injection mold that encapsulates the upper and lower mounting provision as well the center-mounting pin. This design eliminates the potential for moisture ingress and increases the rigidity as well as decreases the flexion on the silicone body under interruption and re-fusing. All Balestro Cutout meet or exceed applicable test requirements including IEEE C 37.41-2000, ANSI C 37.42-1996 and IEC 60.282/05.

Main product advantages:

- Silicone body offers durable and tracking resistant performance;
- Increased leakage distance;
- Not susceptible to ultra violet degradation;
- Ideal for coastal/ high pollution degradation;
- Light in weight for easy handling;
- Bushing design eliminates breakage in shipping and installation;
- Vandal resistant;
- Interchangeable with polymer and porcelain cutouts.

* Utilizes Arc Shortening Rod

The cutout bases have been designed for rated 300A capability. The dimensions "G" and "H" will be maximum values considered at 110° and 140° respectively. The arc shortening rods must be used with removable buttonhead fuse links.

All cutouts furnished including NEMA type-B mounting bracket and tin-plated parallel-groove connectors (6 AWG through 250MCM) with hot galvanized steel connectors button-head bolt.

Due to constant development, this information may be changed without notice. Other models on request.
